IN THE CLAIMS

1-7. (Cancelled)

8. (Currently Amended) A method for depositing a copper-containing seed layer onto a barrier layer, comprising:

providing a substrate comprising the barrier layer disposed on a substrate surface, wherein the barrier layer has a barrier surface selected from the group consisting of a tungsten surface, a tungsten nitride surface, a titanium surface, a titanium nitride surface, a cobalt surface, a ruthenium surface, a nickel surface, and a silver surface, and the barrier layer does not have another layer disposed thereon;

exposing the substrate to a first copper solution comprising complexed copper ions and having a pH value of less than 7, wherein the complexed copper ions are derived from a copper ion source and at least one EDTA ligand ~~selected from the group consisting of copper citrate, copper borate, copper tartrate, copper oxalate, derivates thereof, and combinations thereof~~;

applying a first electrical bias across the substrate surface to chemically reduce the complexed copper ions to ~~deposit~~ form a copper seed layer ~~onto~~ on the barrier surface, wherein the copper seed layer is formed on and across the entire barrier ~~layer~~ surface;

annealing the copper seed layer ~~disposed~~ formed on the substrate; and

depositing a copper gap-fill layer by:

exposing the substrate to a second copper solution comprising free-copper ions; and

applying a second electrical bias across the substrate surface to deposit the copper gap-fill layer ~~onto~~ on the copper seed layer.

9. (Previously Presented) The method of claim 8, further comprising depositing a copper bulk-fill layer by:

exposing the substrate to a third copper solution comprising free-copper ions; and

applying a third electrical bias across the substrate surface to deposit the copper bulk-fill layer onto the copper gap-fill layer.

10. (Original) The method of claim 9, wherein at least one leveling agent is added to the second copper solution to form the third copper solution.

11-19. (Cancelled)

20. (Currently Amended) A method for depositing a copper-containing seed layer onto a barrier layer, comprising:

providing a substrate comprising the barrier layer disposed on a substrate surface, wherein the barrier layer has a barrier surface selected from the group consisting of a tungsten surface, a tungsten nitride surface, a titanium surface, a titanium nitride surface, a cobalt surface, a ruthenium surface, a nickel surface, and a silver surface, wherein the barrier surface has no material layer formed thereon;

exposing the substrate to a complexed copper solution comprising complexed copper ions to chemically reduce ~~reducing the~~ complexed copper ions with a first electrical bias to form a copper seed layer on the barrier surface, wherein the complexed copper ion is from a compound having at a copper ion source and at least one EDTA ligand;

annealing the copper seed layer in an oxygen free environment ~~disposed~~ formed on the substrate; and

depositing a copper gap-fill layer by:

exposing the substrate to a first copper solution comprising free-copper ions; and

applying a second electrical bias across the substrate surface to deposit the copper gap-fill layer ~~onto~~ on the copper seed layer.

21. (Previously Presented) The method of claim 20, further comprising depositing a copper bulk-fill layer by:

exposing the substrate to a second copper solution comprising free-copper ions; and

applying a third electrical bias across the substrate surface to deposit the copper bulk-fill layer onto the copper gap-fill layer.

22. (Previously Presented) The method of claim 21, wherein at least one leveling agent is added to the first copper solution to form the second copper solution.

23-30. (Cancelled)

31. (Currently Amended) A method for depositing a copper-containing seed layer onto a barrier layer, comprising:

providing a substrate comprising the barrier layer disposed on a substrate surface, wherein the barrier layer has a barrier surface selected from the group consisting of a tungsten surface, a tungsten nitride surface, a titanium surface, a titanium nitride surface, a cobalt surface, a ruthenium surface, a nickel surface, and a silver surface, wherein the barrier layer does not have a copper layer disposed thereon;

exposing the substrate to a complexed copper solution comprising complexed copper ions derived from a copper ion source and at least one EDTA ligand ~~selected from the group consisting of copper citrate, copper borate, copper tartrate, copper oxalate, derivates thereof, and combinations thereof~~;

reducing the complexed copper ions with a first electrical bias to form a copper seed layer on the barrier surface, wherein the first electrical bias has a current density of less than about 10 mA/cm^2 across the substrate surface wherein the copper seed layer is directly formed on the barrier surface without intervening layer disposed therebetween; and

depositing a copper gap-fill layer by:

exposing the substrate to a second copper solution comprising free-copper ions; and

applying a second electrical bias across the substrate surface to deposit the copper gap-fill layer ~~onto~~ on the copper seed layer.

32. (Previously Presented) The method of claim 31, further comprising depositing a copper bulk-fill layer by:

exposing the substrate to a third copper solution comprising free-copper ions; and

applying a third bias across the substrate surface to deposit the copper bulk-fill layer onto the copper gap-fill layer.

33. (Original) The method of claim 32, wherein at least one leveling agent is added to the second copper solution to form the third copper solution.

34-38. (Cancelled)

39. (Previously Presented) The method of claim 38, wherein the first copper solution contains a copper concentration within a range from about 0.02 M to about 0.8 M.

40. (Previously Presented) The method of claim 39, wherein the first electrical bias generates a current density of less than about 10 mA/cm^2 across the substrate surface.

41. (Previously Presented) The method of claim 39, wherein the first electrical bias generates a current density within a range from about 0.5 mA/cm^2 to about 3 mA/cm^2 across the substrate surface.

42. (Previously Presented) The method of claim 38, wherein the copper seed layer has a thickness of less than about 200 Å.

43. (Previously Presented) The method of claim 38, wherein the pH value is within a range from about 4.5 to about 6.5.

44. (Previously Presented) The method of claim 8, wherein the barrier layer consists essentially of cobalt, ruthenium, nickel, or tungsten.

45-47. (Cancelled)

48. (Currently Amended) The method of ~~claim 47~~ claim 20, wherein the complexed copper solution contains a copper concentration within a range from about 0.02 M to about 0.8 M.

49. (Previously Presented) The method of claim 48, wherein the first electrical bias generates a current density of less than about 10 mA/cm^2 across the substrate surface.

50. (Previously Presented) The method of claim 48, wherein the first electrical bias generates a current density within a range from about 0.5 mA/cm^2 to about 3 mA/cm^2 across the substrate surface.

51. (Currently Amended) The method of ~~claim 47~~ claim 20, wherein the copper seed layer has a thickness of less than about 200 Å.

52. (Currently Amended) The method of ~~claim 47~~ claim 20, wherein the complexed copper solution comprises a pH value within a range from about 4.5 to about 6.5.

53. (Previously Presented) The method of claim 31, wherein the copper seed layer is deposited on the entire barrier surface.

54. (Cancelled)

55. (Currently Amended) The method of ~~claim 54~~ claim 31, wherein the complexed copper solution contains a copper concentration within a range from about 0.02 M to about 0.8 M.

56. (Previously Presented) The method of claim 55, wherein the current density is within a range from about 0.5 mA/cm^2 to about 3 mA/cm^2 across the substrate surface.

57. (Previously Presented) The method of claim 54, wherein the copper seed layer has a thickness of less than about 200 Å.

58. (Previously Presented) The method of claim 54, wherein the complexed copper solution has a pH value within a range from about 4.5 to about 6.5.

59. (Currently Amended) A method for depositing a copper-containing seed layer onto a barrier material layer, comprising:

providing a substrate having a ruthenium barrier layer disposed on a substrate surface, wherein the ruthenium barrier layer does not have another layer disposed thereon;

exposing the substrate to a first copper solution comprising complexed copper ions and having a pH value of less than 7;

applying a first electrical bias across the substrate surface to chemically reduce the complexed copper ions and to ~~deposit~~ form a copper seed layer onto the ruthenium barrier layer, wherein the complexed copper ion is from a compound having a copper ion source and at least one EDTA ligand;

annealing the copper seed layer in an oxygen free environment ~~disposed~~ formed on the substrate;

depositing a copper gap-fill layer by:

exposing the substrate to a second copper solution comprising free-copper ions; and

applying a second electrical bias across the substrate surface to deposit the copper gap-fill layer ~~onto~~ on the copper seed layer; and

annealing the copper gap-fill layer ~~disposed~~ formed on the substrate.

60. (Cancelled)
